16. (New) A method of controlling card holder verification, said method comprising:
- checking the presence of a trusted association between at least one device and a card usable with the at least one device; and
- suppressing, in response to the presence of the trusted association, involvement of a holder of the card in performing card holder verification.
17. (New) The method of claim 16, wherein the at least one device is located in a trusted environment.
18. (New) The method of claim 16, wherein the card comprises a chipcard.
19. (New) The method of claim 16, wherein the suppressing involvement comprises performing card holder verification hidden from the holder of the card.
20. (New) The method of claim 19, wherein the performing card holder verification comprises automatically obtaining a personal identification number of the holder of the card and verifying the personal identification number without intervention of the holder of the card.
21. (New) The method of claim 16, wherein the suppressing involvement comprises refraining from performing card holder verification.
22. (New) The method of claim 16, wherein the checking the presence of a trusted association between a device of the at least one device and the card comprises comparing a card identifier stored on the card with one or more card identifiers stored in the device.
23. (New) The method of claim 22, wherein the card identifier is associated with a personal identification number usable in card holder verification, and said method further comprises replacing the personal identification number with another personal identification number.
24. (New) The method of claim 22, wherein the card identifier is associated with a personal identification number usable in card holder verification, and said method further

comprises erasing the association between the card identifier and the personal identification number.

25. (New) The method of claim 16, wherein the checking the presence of a trusted association between a device of the at least one device and the card comprises comparing an identifier of the device with one or more device identifiers stored on the card.

26. (New) The method of claim 25, wherein the device identifier is associated with a personal identification number usable in card holder verification, and said method further comprises replacing the personal identification number with another personal identification number.

27. (New) The method of claim 25, wherein the device identifier is associated with a personal identification number usable in card holder verification, and said method further comprises erasing the association between the device identifier and the personal identification number.

28. (New) The method of claim 16, further comprising performing, in response to the checking indicating no trusted association, card holder verification which comprises card holder intervention.

29. (New) The method of claim 16, further comprising associating the at least one device and the card.

30. (New) The method of claim 29, further comprising controlling the association between a device of the at least one device and the card.

31. (New) The method of claim 30, wherein the controlling comprises using a network connectable to the device.

32. (New) The method of claim 16, wherein the checking is between at least one device and a plurality of cards, and wherein the suppressing is for a plurality of holders.

33. (New) A method of performing card holder verification, said method comprising:

obtaining, by a device, an identifier of a card usable with the device;

searching one or more card identifier/personal identification number pairs for the identifier;

sending the personal identification number associated with the searched identifier to the card; and

automatically performing card holder verification using the personal identification number, wherein the automatically performing is absent card holder intervention.

34. (New) A system of controlling card holder verification, said system comprising:

means for checking the presence of a trusted association between at least one device and a card usable with the at least one device; and

means for suppressing, in response to the presence of the trusted association, involvement of a holder of the card in performing card holder verification.

35. (New) The system of claim 34, wherein the means for suppressing involvement comprises means for performing card holder verification hidden from the holder of the card.

36. (New) The system of claim 35, wherein the means for performing card holder verification comprises means for automatically obtaining a personal identification number of the holder of the card and verifying the personal identification number without intervention of the holder of the card.

37. (New) The system of claim 34, wherein the means for suppressing involvement comprises refraining from performing card holder verification.

38. (New) The system of claim 34, wherein the means for checking the presence of a trusted association between a device of the at least one device and the card comprises means for comparing a card identifier stored on the card with one or more card identifiers stored in the device.

39. (New) The system of claim 34, wherein the means for checking the presence of a trusted association between a device of the at least one device and the card comprises means for comparing an identifier of the device with one or more device identifiers stored on the card.

40. (New) A system of performing card holder verification, said system comprising:

at least one device to obtain an identifier of a card, to search one or more card identifier/personal identification number pairs for the identifier, and to send the personal identification number associated with the searched identifier to the card; and

at least one processor to automatically perform card holder verification using the personal identification number, wherein the automatically performing is absent card holder intervention.

41. (New) An article of manufacture comprising:

at least one computer usable medium having computer readable program code logic to control card holder verification, the computer readable program code logic comprising:

check logic to check the presence of a trusted association between at least one device and a card usable with the at least one device; and

suppress logic to suppress, in response to the presence of the trusted association, involvement of a holder of the card in performing card holder verification.

42. (New) The article of manufacture of claim 41, wherein the suppress logic to suppress involvement comprises perform logic to perform card holder verification hidden from the holder of the card.

43. (New) The article of manufacture of claim 42, wherein the perform logic comprises obtain logic to automatically obtain a personal identification number of the holder of the card and verify logic to verify the personal identification number without intervention of the holder of the card.

44. (New) The article of manufacture of claim 41, wherein the suppress logic to suppress involvement comprises refrain logic to refrain from performing card holder verification.

45. (New) The article of manufacture of claim 41, wherein the check logic to check the presence of a trusted association between a device of the at least one device and the card comprises compare logic to compare a card identifier stored on the card with one or more card identifiers stored in the device.

46. (New) The article of manufacture of claim 41, wherein the check logic to check the presence of a trusted association between a device of the at least one device and the card comprises compare logic to compare an identifier of the device with one or more device identifiers stored on the card.

47. (New) An article of manufacture comprising:

at least one computer usable medium having computer readable program code logic to perform card holder verification, the computer readable program code logic comprising:

obtain logic to obtain, by a device, an identifier of a card usable with the device;

search logic to search one or more card identifier/personal identification number pairs for the identifier;

send logic to send the personal identification number associated with the searched identifier to the card; and

perform logic to automatically perform card holder verification using the personal identification number, wherein the automatically performing is absent card holder intervention.
